

# Codling Moth Lure

*Cydia pomonella*

CYPO01, CYPO08, CYPO10

A species of moth with the greatest potential for apple damage of any apple pest, yet it can be effectively controlled with properly time treatments. Codling moth also damages pear, plum, and walnut. For monitoring populations and as part of an effective mating disruption treatment you will need AlphaScents™ Codling moth lures placed inside either single use paper or multi-season use AlphaScents™ plastic pheromone delta traps. Codling moth lures include:

- CYPO01 – red standard 1 mg, 5 weeks
- CYPO08 – grey long life 3 mg, 8 weeks
- CYPO10 – red supercharged 10 mg lures

## Application

Plastic Trap: Put septum on top of liner and coaster packet under liner. Paper Trap: Put septum on sticky floor and hang coaster from roof crown with paper clip.

Best placement of monitoring traps and which AlphaScents™ Codling moth lure to use - 5, 8, or 10 - depends upon a number of variables.

Consult [www.alphascents.com](http://www.alphascents.com) or your local county extension office for best practices.
